Retirement Gateway® is a group variable annuity. Annuities are long-term financial products designed for retirement purposes. This performance data represents past performance, which is not an estimate, indication or guarantee of future results. Rates of return and principal will fluctuate, and units may be worth more or less than your original contribution when redeemed. Current performance may be lower or higher than the performance data quoted. Please refer to the last page for additional important information.

Returns of less than one year are not annualized.

The variable investment options under the group annuity contract, which are divisions in Equitable Financial's separate account, invest in corresponding portfolios of various mutual funds. Performance data shown here for any period prior to the date that the variable investment option was available under the separate account (Separate Account No. 65 Inception Date:12/01/96) is based on the inception date of the oldest class of share of the corresponding portfolio. The Fund Inception Date column in this report represents the date the share class of the mutual fund being offered currently was first established. The Since Inception column represents the average annual overall performance for the oldest class of share since its original inception including the period before its introduction as a variable investment option under the group annuity contract. The performance data for a variable investment option reflects changes in the prices of its investments including, the shares of a corresponding portfolio, reinvestment of dividends and capital gains. It does not reflect deductions for the Separate Account Charge, contract-level charge, Contingent Withdrawal Charge or administrative charge. If such charges were included, performance returns would be lower. Because of ongoing market volatility, a fund's performance may be subject to fluctuations and current performance may be less than the results shown above. An investment in a variable investment option when redeemed, may be worth more or less than the original cost.

IMPORTANT INFORMATION

The expense ratio shown is the investment option's net expense ratio. Refer to the investment option's prospectus for its gross expense ratio, if applicable, and for additional information on its benchmarks.

Subject to the terms of the Employer's plan and the code, in exchange for contributions made to the contract, Equitable Financial Life Insurance Company will provide the annuity benefit options available under the contract. Typically, variable annuities have mortality and expense charges, account fees, investment management fees and administrative fees. In addition, annuity policies have exclusions and limitations, early withdrawals may be subject to surrender charges and if taken prior to age 59½, a 10% federal income tax penalty. Variable annuities are subject to risks, including the possible loss of principal invested.

An annuity contract that is purchased to fund a qualified retirement plan should be done so for the annuity's features and benefits other than tax deferral. For such cases, tax deferral is not an additional benefit for the annuity. You may also want to consider the relative features, benefits, and costs of this annuity with any other investment that you may have in connection with your retirement plan or arrangement.

You will incur higher costs with the asset allocation portfolios than if you were to invest directly in the underlying investment portfolios. The target date is the approximate date when investors plan to start withdrawing their money. The principal value of the portfolios is not guaranteed at any time, including at the target date. International securities involve additional risks due to currency fluctuations, economic and political conditions, and differences in financial reporting standards. Bond investments are subject to interest rate risk so that when interest rates rise, the price of bonds can decrease and the investor can lose principal value. High yield bonds are subject to a high degree of credit and market risk.

Small- and mid-capitalization stocks are subject to a higher degree of market risk than large capitalization stocks of more established companies. Even though large cap stocks are perceived to be less risky than smaller cap companies, they still involve risks, i.e., they will fluctuate in value and you can lose money. Investing in commodity-related securities may present special risks including market price movements and regulatory and economic changes, as well as sector concentration risks. The assets in a non-diversified portfolio may be focused on a smaller number of issues or one sector of the market that may make the value of the portfolio's shares more susceptible to certain risk than shares of a diversified portfolio.

Investing in value stocks is based upon a portfolio manager's subjective assessment of fundamentals of the companies he or she believes are undervalued. This style of investing may increase the volatility of the portfolio and may not produce the intended results over short or long time periods. Larger, more established companies may not be able to attain higher growth rates of smaller companies, especially during extended periods of economic expansion. Investing in growth stocks is based upon a portfolio manager's subjective assessment of fundamentals of companies he or she believes offer the potential for price appreciation. This style of investing involves risks and investors can lose money.

The current yield for the EQ/Money Market B portfolio as of 09/30/23 is 4.69% and as of 11/30/23 is 4.73%. This yield quotation more closely reflects the current earnings of the investment portfolio than the total return quotation. It does not reflect any product related expenses or charges. This is a seven day current yield as of the last day of the month to which the performance relates. As of April 1, 2016 the EQ/Money Market Portfolio was designated as a "government money market fund," as defined in Rule 2a-7 under the Investment Company Act of 1940, and prior to that date the Portfolio invested in certain types of securities that it is no longer permitted to hold. Consequently, the performance shown may be different if the current limitations on the Portfolio's investments had been in effect prior to its conversion to a government money market fund. You could lose money by investing in the portfolio. Although the portfolio seeks to preserve the value of your investment at \$1.00 per share, it cannot guarantee it will do so. An investment in the portfolio is not insured or guaranteed by the Federal Deposit Insurance Corporation or any other government agency. The portfolio's sponsor has no legal obligation to provide financial support to the portfolio, and you should not expect that the sponsor will provide financial support to the portfolio at any time.

Interest Rate Risk applies to fixed income securities. Fixed income securities will decline in value because of changes in interest rates. When interest rates rise, the value of a portfolio's debt securities generally declines. When interest rates decline, the value of a portfolio's debt securities generally rises.

Despite the short maturities and high credit quality of the EQ/Money Market Portfolio's investments, increases in interest rates and deteriorations in the credit quality of the instruments the Portfolio has purchased may reduce the Portfolio's yield and can cause the price of a money market security to decrease.

Bonds rated below investment grade (i.e. BB by S&P or Fitch or Ba by Moody's) are speculative in nature and are subject to additional risk factors such as increased possibility of default, illiquidity of the security, and changes in value based on changes in interest rates. "Junk bonds" are usually issued by companies without long track records of sales and earnings, or by those companies with questionable credit strength.

Investments in large-cap companies may involve the risk that larger more established companies may be unable to respond quickly to new competitive challenges such as changes in technology and consumer tastes.

Investing in the Allocation Portfolios will involve a higher overall cost than if you were to invest directly in the underlying portfolios. It is important to note that asset allocation does not assure a profit or protect against loss in a declining market.

Derivatives are subject to a number of risk such as leverage risk, liquidity risk, interest rate risk, market risk, credit risk and also involve the risk of mispricing or improper valuation. The Portfolio's investments in derivatives may rise or fall more rapidly than other investments.

IMPORTANT INFORMATION (CON'T)

Certain investments may involve credit risk. Credit risk is the risk that the issuer or the guarantor of a fixed income security, or the counterparty to a derivatives contract, repurchase agreement, loan of portfolio securities or other transaction, is unable or unwilling, or is perceived (whether by market participants, ratings agencies, pricing services or otherwise) as unable or unwilling, to make timely principal and/or interest payments, or otherwise honor its obligations.

Even though the market price of an exchange traded fund (ETF) is derived from the securities it owns, such price at any given time may be at, below or above the ETF's net asset value. Many ETF's invest in securities included in, or representative of, underlying indexes. A portfolio that employs an index strategy generally will not modify its index strategy to respond to changes in the economy, which means that it may be particularly susceptible to a general decline in the market segment relating to the relevant index. There is also the risk that an ETF's performance may not match that of the relevant index.

A portfolio that invests primarily in a particular sector could experience greater volatility than portfolios investing in a broader range of industries.

The risk that the principal on mortgage- and asset-backed securities held by a Portfolio may be prepaid, which generally will reduce the yield and market value of these securities. If interest rates fall, the rate of prepayments tends to increase as borrowers are motivated to pay off debt and refinance at new lower rates. Rising interest rates may increase the risk of default by borrowers and tend to extend the duration of these securities, making them more sensitive to changes in interest rates and they may experience additional volatility and losses. A Portfolio that invests in Underlying Portfolios will indirectly bear fees and expenses charged by the Underlying Portfolios, in addition to the Portfolio's direct fees and expenses. The Portfolio is also subject to the risks associated with the securities in which the Underlying Portfolios invest.

Alternative investments use strategies that differ from the buy-and-hold strategy typical in the mutual fund industry. Compared to a traditional mutual fund, an alternative fund typically holds more aggressive non-traditional investments and employs more complex trading strategies. Alternative investments can be less liquid and more volatile than traditional investments and often lack longer term track records. Investors considering alternative funds should be aware of their unique characteristics and risks as described in the prospectus before investing.

Portfolios that feature Equitable Financial's proprietary managed-volatility strategy (or may invest in underlying portfolios that feature this strategy) utilize futures and options to manage equity exposure when market volatility increases above specific thresholds set for the portfolio. It is not possible to manage volatility fully or perfectly, which could cause these portfolios to underperform or experience losses.
